The NexGard® (afoxolaner) Satisfaction Guarantee is like no other in veterinary medicine.7

✓ NexGard Flea Satisfaction Guarantee*
✓ NexGard Lyme Satisfaction Guarantee*

* For more details, including full terms and conditions, visit www.nexgardfordogs.com.

Powerful against fleas and ticks. Gentle on dogs.

The #1 choice of Vets1
NexGard® (afoxolaner) is available in four sizes of beef-flavored, soft chewables for oral administration to dogs and puppies according to their weight. Each chewable is formulated to provide a minimum afoxolaner dosage of 1.14 mg/lb (2.5 mg/kg). Afoxolaner has the chemical composition 1-Naphthalenecarboxamide, 4-[3-[3-chloro-5-(trifluoromethyl)-phenyl]-4, 5-dihydro-5-( trifluoromethyl)-3-isoxazolyl]-N-[2-oxo-2-[(2,2,2-trifluoroethyl)amino]ethyl.

Indications: NexGard kills adult fleas and is indicated for the treatment and prevention of flea infestations (Ctenocephalides felis), and the treatment and control of Black-legged tick (Ixodes scapularis), American Dog tick (Dermacentor variabilis), Lone Star tick (Amblyomma americanum), and Brown dog tick (Rhipicephalus sanguineus) infestations in dogs and puppies 8 weeks of age and older weighing 4 pounds of body weight or greater, for one month. NexGard is indicated for the prevention of Borrelia burgdorferi infections as a direct result of killing leeches scapularis vector ticks.

Dosing and Administration: NexGard is given orally once a month, at the minimum dosage of 1.14 mg/lb (2.5 mg/kg).

Dosing Schedule:

NexGard can be administered with or without food. Care should be taken that the dog consumes the complete dose, and treated animals should be observed for a few minutes to ensure that part of the dose is not lost or refused. If it is suspected that any of the dose has been lost or vomiting occurs within two hours of administration, refeed with another full dose. If a dose is missed, administer NexGard and resume a monthly dosing schedule.

Flea Treatment and Prevention: Treatment with NexGard may begin at any time of the year. Treatment with NexGard should continue the entire year without interruption. To minimize the likelihood of fleas reinfection, it is important to treat all animals within a household with an approved flea control product.

Tick Treatment and Control: Treatment with NexGard may begin at any time of the year (see Effectiveness).

Contraindications: There are no known contraindications for the use of NexGard.

Warnings: Not for use in humans. Keep this and all drugs out of the reach of children. In case of accidental ingestion, contact a physician immediately.

Precautions: Afoxolaner is a member of the isoxazoline class. This class has been associated with neurologic adverse reactions including tremors, ataxia, and seizures. Seizures have been reported in dogs receiving isoxazoline class drugs, even in dogs without a history of seizures. Use with caution in dogs with a history of seizures or neurologic disorders.

The safe use of NexGard in breeding, pregnant, or lactating dogs has not been evaluated.

Adverse Reactions: In a well-controlled US field study, which included a total of 233 households and 615 treated dogs (415 administered afoxolaner, 200 administered active control), no serious adverse reactions were observed with NexGard.

Over the 90-day study period, all observations of potential adverse reactions were recorded. The most frequent reactions reported at an incidence of > 1% within any of the three months of observations are presented in the following table. The most frequently reported adverse reaction was vomiting. The occurrence of vomiting was generally self-limiting and of short duration and tended to decrease with subsequent doses in both groups. Five treated dogs experienced anorexia during the study, and two of these dogs experienced anorexia with the first dose but not subsequent doses.

Table 1: Dogs With Adverse Reactions.

Number of dogs in the afoxolaner treatment group with the identified abnormality.

In the US field study, one dog with a history of seizures experienced a seizure on the same day after receiving the first dose and on the same day after receiving the second dose of NexGard. This dog experienced a third seizure one week after receiving the third dose. The dog remained enrolled and completed the study. Another dog with a history of seizures had a seizure 19 days after the third dose of NexGard. The dog remained enrolled and completed the study. A third dog with a history of seizures received NexGard and experienced no seizures throughout the study.

Post-Approval Experience (July 2018): The following adverse events are based on post-approval adverse drug experience reporting. Not all adverse events are reported to FDA/CVM. It is not always possible to reliably estimate the adverse event frequency or establish a causal relationship to product exposure using these data. The following adverse events reported for dogs are listed in decreasing order of reporting frequency for NexGard: Vomiting, pruritus, lethargy, diarrhea (with and without blood), anorexia, seizures, hyperactivity/restlessness, panting, erythema, ataxia, dermatitis (including rash, papules), allergic reactions (including lures, swelling), and tremors.

Contact Information: For a copy of the Safety Data Sheet (SDS) or to report suspected adverse drug events, contact Boehringer Ingelheim Animal Health USA Inc. at 1-888-637-4251 or www.nexgardfordogs.com.

For additional information about adverse drug experience reporting for animal drugs, contact FDA at 1-888-FDA-VETS or www.fda.gov/reportadverse.

Mode of Action: Afoxolaner is a member of the isoxazoline family, shown to bind at a binding site to inhibit acaride and acarid-gated chloride channels, in particular those gated by the neurotransmitter gamma-aminobutyric acid (GABA), thereby blocking pre- and post-synaptic transport of chloride ions across cell membranes. Prolonged afoxolaner-induced hyperexcitation results in uncontrolled activity of the central nervous system and death of insects and arachnids. The selective toxicity of afoxolaner between insects and arachnids and mammals may be inferred by the differential sensitivity of the insects and acarids. GABA receptors versus mammalian GABA receptors.

Effectiveness: In a well-controlled laboratory study, NexGard began to kill fleas four hours after initial administration and demonstrated >99% effectiveness at eight hours. In a separate well-controlled laboratory study, NexGard demonstrated 100% effectiveness against adult fleas 24 hours post-infestation for 35 days, and >83% effective at 12 hours post-infestation through Day 21, and on Day 35. On Day 28, NexGard was 81.1% effective 12 hours post-infestation. Dogs in both the treated and control groups that were infested with fleas on Day -1 generated flea eggs at 12- and 24-hours post-treatment (0-11 eggs and 1-17 eggs in the NexGard treated dogs, and 0-90 eggs and 0-118 eggs in the control group on Day 12 and 24-hours, respectively). At subsequent evaluations post-infestation, fleas from dogs in the treated group were essentially unable to produce any eggs (0-1 eggs) while fleas from dogs in the control group continued to produce eggs (1-141 eggs).

In a 90-day US field study conducted in households with existing flea infestations of varying severity, the effectiveness of NexGard against fleas on the Day 30, 60, and 90 visits compared with baseline was 98.0%, 99.7%, and 99.6%, respectively. Collectively, the data from the three studies (two laboratory and one field) demonstrate that NexGard kills fleas before they can lay eggs, thus preventing subsequent flea infestations after the start of treatment of existing flea infestations. In well-controlled laboratory studies, NexGard demonstrated >97% effectiveness against Dermacentor variabilis, >94% effectiveness against Ixodes scapularis, and >83% effectiveness against Rhipicephalus sanguineus. 48 hours post-infestation for 30 days. At 72 hours post-infestation, NexGard demonstrated >97% effectiveness against Amblyomma americanum for 30 days. In two separate, well-controlled laboratory studies, NexGard was effective at preventing Borrelia burgdorferi infections after dogs were infested with Ixodes scapularis vectors 28 days post-treatment.

Animal Safety: In a margin of safety study, NexGard was administered orally to 8 to 9-week-old Beagle puppies at 1, 3, and 5 times the maximum exposure dose (8.3 mg/kg) for three treatments every 28 days, followed by three treatments every 14 days, for a total of six treatments. Dogs in the control group were sham-dosed. There were no clinically-relevant effects related to treatment on physical examination, body weight, food consumption, clinical pathology (hematology, clinical chemistries, or coagulation tests), gross pathology, histopathology or organ weights. Vomiting occurred throughout the study, with a similar incidence in the treated and control groups, including one dog in the 5x group that vomited four hours after treatment. In a well-controlled field study, NexGard was used concomitantly with other medications, such as vaccines, anthelmintics, antibiotics (including topicals), steroids, NSAIDS, anesthetics, and antihistamines. No adverse reactions were observed from the concomitant use of NexGard with other medications.

Storage Information: Store at or below 30°C (86°F) with excursions permitted up to 40°C (104°F).

How Supplied: NexGard is available in four sizes of beef-flavored soft chewables: 11.3, 28.3, 68, or 136 mg afoxolaner. Each chewable size is available in color-coded packages of 1, 3, or 6 beef-flavored chewables.

Approved by FDA under NADA # 141-406

Frontline Vet Labs™
The tasty chew that dogs prefer

- Kills fleas and ticks fast
- Kills adult fleas before they can lay eggs
- Kills the ticks most commonly found on dogs in the US
- FDA-approved to prevent Lyme infections by killing black-legged ticks
- Proven safe for puppies as young as 8 weeks and for dogs as little as 4 lbs
- Protects ALL month long in a bite-sized monthly dose
- Can be given with or without food
- Easy to give: dogs love it!

IMPORTANT SAFETY INFORMATION: NexGard® is for use in dogs only. The most frequently reported adverse reactions include vomiting, itching, lethargy, diarrhea and lack of appetite. The safe use of NexGard in pregnant, breeding, or lactating dogs has not been evaluated. Use with caution in dogs with a history of seizures or neurologic disorders. For more information, see full prescribing information inside this brochure or visit www.NexGardForDogs.com.
Dogs pick up fleas from infested environments where untreated pets and wildlife have been.

By the time you see fleas on your dog, an infestation has likely already been established in the home environment.

A female flea can lay up to 50 eggs per day on a pet. These eggs fall off wherever an infested animal goes.

Here’s why monthly prevention matters:

Fleas can cause a number of problems, including:
• Scratching and discomfort
• Anemia
• Skin irritation
• Tapeworms
• Flea allergy dermatitis

The importance of prevention
• Preventing flea infestations on your dog is essential
• Prevention of flea infestations is easier and less expensive than trying to eliminate an established infestation in the home environment

NexGard® (afoxolaner)
• Kills fleas fast before they can lay eggs
• Prevents flea infestations on your dog
• Keeps working all month long

Prevent flea infestations
Give NexGard to your dog monthly.

Make sure all the pets in your house, even indoor cats, are treated with an appropriate flea and tick control product. Remember, NexGard is for dogs only.

IMPORTANT SAFETY INFORMATION: NexGard® is for use in dogs only. The most frequently reported adverse reactions include vomiting, itching, lethargy, diarrhea and lack of appetite.

Use with caution in dogs with a history of seizures or neurologic disorders. For more information, see full prescribing information inside this brochure or visit www.NexGardForDogs.com.
NexGard® (afoxolaner) kills these ticks of veterinary importance. All month long.

**Ticks are Searching for Hosts from Coast to Coast**

- **Black-legged (deer) tick** *(Ixodes scapularis)*
- **Lone star tick** *(Amblyomma americanum)*
- **American dog tick** *(Dermacentor variabilis)*
- **Brown dog tick** *(Rhipicephalus sanguineus)*

**Protect your dog from the dangers of ticks:**

- Reduce exposure to tick-infested areas
- Take steps in yard to reduce habitat suitable for ticks and wildlife hosts
- Check for ticks regularly and remove any ticks found
- Talk to your vet about the importance of Lyme disease vaccination for your dog
- Use NexGard every month, year round

**NexGard is FDA-approved to prevent Lyme infections as a result of killing black-legged ticks.**

**Lyme Disease in Dogs**

- Commonly diagnosed in dogs in the US
- Majority of cases reported in the Northeast, Mid-Atlantic, and upper Midwest, but Lyme infections have been diagnosed in dogs in all 50 states

**LYME DISEASE - 2019 PREVALENCE MAP**

> 350,000 positive cases in dogs in the US

**IMPORTANT SAFETY INFORMATION:** NexGard® is for use in dogs only. The most frequently reported adverse reactions include vomiting, itching, lethargy, diarrhea and lack of appetite.

Use with caution in dogs with a history of seizures or neurologic disorders. For more information, see full prescribing information inside this brochure or visit [www.NexGardForDogs.com](http://www.NexGardForDogs.com).
Proven and trusted protection

NexGard® (afoxolaner) was designed to balance its effect on dogs and its efficacy against fleas and ticks. The fast-acting NexGard chew is safe and effective for an entire month.

• Proven safe for puppies as young as 8 weeks of age and dogs weighing as little as 4 lbs
• Approved in over 100 countries with over 220 million doses sold in the US4
• Every bite-sized monthly dose works effectively when given with or without food
• FDA-approved to prevent Lyme infections in dogs as a result of killing black-legged ticks

IMPORTANT SAFETY INFORMATION: NexGard® is for use in dogs only. The most frequently reported adverse reactions include vomiting, itching, lethargy, diarrhea and lack of appetite. The safe use of NexGard in pregnant, breeding, or lactating dogs has not been evaluated. Use with caution in dogs with a history of seizures or neurologic disorders.
